Guest Speaker Summary: Dr. Inga Becker from Siemens.

Dr. Igna Becker from siemens started with an overview of the company, which has over 300,000 employees worldwide and locations in over 200 countries. Siemens reported 78.9 billion in revenue, 88.4 billion in orders, 10.8 billion in free cash flow, and 15.4% profit margins as some of the statistics form her corporate slide. The company works across many fields including factory automation, software, smart buildings, electrification, electric products, and mobility. Mobility covers the rolling stock, rail infrastructure, and turnkey projects. She shared some numbers about the impacts of Siemens technology: up to 50% material savings and 39% of global energy-related carbon emissions are caused by buildings.

She went deper into different sectors within Siemens, and spoke about some professionals within the company that came from engineering backgrounds. They all ended up in different sectors around the company such as product manager, general manager, technical support engineer, and head of R&D in smart infrastructure buildings. She spoke about the parts of the company such as the Siemens Financial Services, Real Estate, Global Business Services, and Foundational Technologies. Dr. Becker works in Foundational Technologies, which is th eresearch side that keeps up with industry technology and stays up to date with the newest technologies. Their research includes cybersecurity and trust, integrated circuits, and industrial and power electronics to name a few.

Her own career started with getting a PHD in Chemistry and moving into materials research within Siemens. She then worked in University relations while also taking parental leave twice and coming back to the company afterwards (which is apparently easier to do overseas). She stressed the importance of having a work life balance. In her current role as an R&D strategy professional, she connects university students, professors, researchers, and many more individuals to Siemens through guided projects and bringing global teams together. She does this through translating industrial challenges into the research needs and connecting U.S. teams with Siemens headquarters in Germany.

She closed her presentation with three ways that students can get involved today. She posted a link to the Siemens job and internship page at jobs.siements.com. She also suggested joining student talent programs, rotational programs for graduates, or the student ambassador network. Then she spoke about projects that can make you stand out as a student, such as their upcoming 2027 Immersive Design Challenge. The third choice was to begin getting familiar with the free student software that Siemens offers such as NX, SolidEdge, and Simcenter. There are also occasional webinars available for extra knowledge. THe next upcoming webinar is NOV 18 2026 at 7am PST. Finally she suggested looking into an official micro credential to place on your

resume and to follow Roland Busch, the President and CEO of Siemens AG, on Linkedin
