

Topic: Timeline of Stock Market (2000s)

Purpose: To inform the audience about the major crashes and events that occurred within the stock market during the 2000s

Thesis: The stock market's journey since 2000 shows a series of strong recoveries, as well as huge growth, reflecting on both economic challenges and resilience.

Introduction

1. A. In just 25 years, the stock market has seen two of the biggest crashes in history. Why does this matter to you? Because this market reflects the economic status of the U.S. as a whole.
2. B Understanding the stock market's history can help you all invest for the long-term growth that it can provide. This is a great source of income through its average growth of 9% annually.
3. C In this speech, I will give a preview timeline on the two grand crashes of the 21st century within the stock market and how they were caused as well as their effect on the national economy.

Transition: Let's start with one of these events which I'm sure most of you have heard about – the 2008 financial crisis.

Body 1 : 2008 Crash

1. A. Causes - "housing bubble and subprime mortgages" (low interest rates and loans given to people with low credit)
Banking Credit Freeze - Scared of lending because they were unaware of who was holding "toxic assets"
2. B. Impact - Millions of job losses (unemployment rate of 10%), 4.3% decline in GDP, drop in housing prices and household wealth.
3. C. Recovery - Government bailouts - Troubled Asset Relief Program) (TARP) and Federal Reserve intervention (Emergency Economic Stabilization Act) helped stabilize the market.

Transition: Just over a decade later, another global event affected the market in a similar way – the COVID-19 shutdown.

Body 2 : 2020 Crash

1. A. Causes - Pandemic caused fear - World Health Organization (WHO),
2. B Impact - Lead to economic shutdowns (Dow Jones Industrial Average (DJIA), S&P 500 lost 34% of its value
3. C Recovery - Tech stock growth, low interest rates, and S&P 500 ended up 15% on the year, NASDAQ soared over 43%

Transition: Although these crashes sound fatal to the economy, they always come to an even higher recovery than where they started.

Body 3: Overall NASDAQ / Market Growth (Recently)

1. A Tech Boon - Companies like APPL, NVDA, AMZN, AVGO had exponential gains
2. B Record Highs - Recently NASDAQ and S&P 500 hit all-time highs

3. C Long-Term Lesson- Short-term trading is volatile and untrustworthy. Long-term trading and holding can lead to massive gains over time.

Transition: So, what should be the takeaway from this timeline of the stock market?

Conclusion (Concluding Statement)

Restate Thesis: The stock market timeline of the 2000s shows the repeated cycle of economic collapse, followed by record high recovery.

Main Points: From the 2008 crash, to the 2020 pandemic, to the recent record highs— each period always ended with record growth.

Closing Thought: You can never predict the market, but in the long-run, you can always make a huge profit from simply investing your money into America.
